Abstract (en)
[origin: EP1832432A1] A printing apparatus is provided which eliminates complexity of power-ON operation and can enter into print preparation when print is enabled. The printing apparatus is started on so-called sleep mode or energy saving mode in which power is supplied only to the control portion and a sensor portion. If a detection signal is received from a personal computer (S5: YES), four printable conditions, that is, whether or not a cover is closed (S7), whether or not a tape is loaded normally (S9), whether or not a cutter operates normally (S11) and whether or not battery voltage is within a normal range (S13) are checked successively, and if all the conditions are satisfied, the main power supply is turned ON (S15). Consequently, the print mechanism and other portions are supplied with power so that the entire printing apparatus is supplied with power. As a result, the print preparation processing is executed (S17), and the printing apparatus waits for reception of print data (S19).
