Abstract (en)

[origin: EP1832884A2] The method involves connecting additional resistances (33, 34) to an aerial electric line (51) and reference potential (50) when a measurement voltage value (V1) is not determined. An additional voltage value (V2) is determined so that the line is connected to the potential by the resistances, where the values are compared. Presence of real voltage on the line is indicated if the ratio of the value (V2) to the value (V1) is more than or equal to a preset coefficient so that the presence of induced voltage on another line is indicated if the ratio is lower than the coefficient. An independent claim is also included for a detector for detecting voltage to implement a voltage detection method.
