Abstract (en)
[origin: WO2006058282A2] An electrolytic device and method for generating a sterilizing solution that utilizes hydrogen produced at the cathode as a further means to discharge biofilm material, microorganisms, and other organic material from the cathode surface. The device to be cleaned is typically electrically conductive and acts as a cathode, preferably by being in electrical contact with the cathode tray of the system. Aqueous Chlor-oxygen disinfectants produced within the device can be circulated through internal components of devices or instruments that may have internal passages. Gasses generated from the electrolysis operation, primarily hydrogen that is liberated at the cathode surface, are passively or forcibly vented from the system or are neutralized by a catalytic recombiner.
