Abstract (en)
[origin: WO2006063839A1] The invention relates to a device for producing a metallic product (1) by rolling, comprising: a first area (2) inside of which slabs are produced by primary shaping; a second area (3), which is located downstream from the first area (2) in the direction of flow (F) of the material and inside of which at least one first rolling device (4) for rolling slabs is arranged; a third area (5), which is located downstream from the second area (3) in the direction of flow (F) of the material and inside of which at least one second rolling device (6) for rolling slabs or the intermediate product produced therefrom is arranged, and; a fourth area (7), which is located downstream from the third area (5) in the direction of flow (F) of the material and inside of which at least one aftertreating device (8) for the rolled material is arranged. In order to increase the economic efficiency of the device, this device is characterized by having a conveying device (9) with which the metallic product (1) can be removed between the second area (3) and the third area (5), conveyed and can be fed to the processing process once again between the third area (5) and the fourth area (7).
