Abstract (en)

[origin: WO2006027000A1] A new full displacement technique capable of improving the soil properties to resist different loads, cutoff seepage, and construct piles and flexible walls. The constructed works integrate with the improved surrounding soil in resisting lateral and vertical loads. All the soil improvement systems are performed using single machine having a special driving vibrator and different compaction and pouring casings and applying an innovative construction technique. This patent constitutes practical solution for problems of soft soils.
