Abstract (en)

[origin: WO2006069751A1] The invention relates to a multi-layer system, method for production and use thereof in electro-optical components. Said multi-layer system comprises a) a mesoporous layer of a semiconductor, optionally applied to an electrode, b) a layer in contact with the mesoporous layer (a) containing at least one layer of an anionic and a cationic polyelectrolyte, optionally with semiconductor properties, c) optionally one or more further layers, containing organic functional materials and d) optionally a counter electrode, which may be produced by polyelectrolyte adsorption of the polyelectrolyte on the mesoporous layer which is suitable for application in electro-optical components, such as solar cells, photodetectors, and (photo)electrochromic devices.
