Abstract (en)

[origin: EP1834553A2] The stand (1) has retaining elements (8) which comprise a flexible element below a form-rigid retaining area (14). The retaining element is mountable in the mounting block (7) by flexible element, where the flexible element and its retainer (17) are formed such that, the retaining element is pivoted in the mounting block from an open position into a retaining position. The retaining element is led in the mounting block under withdrawal of a physical drag axis in this motion and that it makes available a spring action working against pivoting.
