Abstract (en)

The present invention provides a game machine authentication management device 10 and a game device for transmitting an authentication request and ID data to an authentication server 24 through first communication means 110, waiting for a response including the authentication result data in a reception-enabled state, acquiring authentication level data capable of indicating any one of the events of authentication OK, authentication NG and timeout, transmitting electronic money terminal setting data and an electronic money operation instruction according to the authentication level data to an electronic money terminal 134 through second communication means or third communication means, and suspending the electronic money terminal setting data and the electronic money operation instruction in at least one of the cases. The electronic money terminal setting data may be stored in a penalty setting server 140 or the like.
