Abstract (en)

[origin: EP1834850A1] The method involves transmitting coded light signals (18) from a light source to an interior (14), where the transmitted light signals are received by a sensor (20). Runtimes of the received light signals (18`) are determined. The runtimes of received light signals (18`) are compared with a reference runtime. An alarm is released, if the deviation of the runtime of the received light signal from the reference runtime exceeds a pre-determined threshold value. An independent claim is also included for a device for monitoring a vehicle interior.
