Abstract (en)

[origin: DE102006012102B3] The method involves bringing an undercoat that forms an appropriate adherence for adjacent coating. An exit layer is brought with a thickness of 0.3 to 5 millimeter from papescient, impermeably hardening coating material, which holds a three-dimensional structure that is received during three-dimensional changing. A compressed air is blown with air flow by a nozzle (8) of an air gun (5), which impinges on a planar area of the exit layer from a non-papescient coating material, where a wave-like texture of the exit layer is produced and the coating material is hardened. An independent claim is also included for a structural panel manufactured as finished part.
