Abstract (en)
The invention relates to a connecting system with at least a first and a second connector element which are insertable, one into the other, comprising an insertion obstruction device, and further comprising an abutting arrangement being connected to said first connector element via a resilient, preferably arm-like connecting member and abutable against the second connector element in at least a portion of the insertion path. Said abutting arrangement thereby forms a part of the insertion obstruction device and is movable in insertion direction in an abutted state in respect of the first connector element wherein the abutted state is deactivatable upon further insertion of the connector elements and said abutting arrangement is movable in the insertion direction in respect of the second connector element.
