Abstract (en)

[origin: WO2006073246A1] An apparatus for reproducing data recorded on a recording medium includes a pickup unit, a plurality of local storages, and a controller. The pickup unit reads a disc package from the recording medium. The local storages store multiple binding units associated with the disc package, and the controller generates a virtual package by binding the multiple binding units and the disc package according to binding priorities of files included in the multiple binding units. When the multiple binding units include two or more identical files to be bound, a file having a highest binding priority is selected in the virtual package.
