Abstract (en)

[origin: DE102005002497B3] The method and device for producing hollow building blocks involves an open press mould (6) that has a height adjustable indenter (11) together with a retractable press plate (14) located in the press mould which is penetrated from below by the indenter. Once the press mould is filled with a granular mould material (F) the indenter is immersed and the material enters in the press plate. Under compression from the indenter, the material is pressed in a number of different ways. The press-plate may operate, step-wise, when pressing the material, whilst the indenter may move the same distance downwards at each step.
