Abstract (en)
[origin: WO2006075099A1] The sensor system in particular for a vehicle parking system which is provided with a series of sensor (7) and a series of conductors having a computer for information read out by said sensors is characterised in that said system comprises a layer (1) provided with a series of conductor tracks (2) connected to the sensors for feeding them and for transferring the information read out by said sensors (7), wherein said layer is cut out in such a way that the elements (3, 4, 5, 6) for each sensor (7) are formed, at least one element is folded in such a way that it has a first fold substantially extending in a perpendicular direction to the layer longitudinal edge and a second fold leading to the corresponding sensor and determining a second part substantially extending in a parallel position with respect to said longitudinal edge.
