Abstract (en)

[origin: WO2006076919A2] According to the invention, a closure system (3) for a container (5), where the container (5) has a mainly upwards facing opening (9) which is delimited by a frame member (8), which frame member (8) interacts with at least one lid face (11) is peculiar in that sash members (12) are provided at two opposing sides of the lid face (11) which by displacing the lid face (11) and by interaction with the frame members (8) entails that the lid face (11) is moved in the direction of the force of gravity (15). Hereby is achieved that the closure system closes or pulls the lid face (11) entirely shut each time a customer has opened the container (5) or the freezer with the purpose of taking out an article therefrom.
