Abstract (en)

[origin: WO2006077017A1] The invention relates to a method for determining a space coordinate of a measuring point on a test object. According to said method, a probing head is placed on the measuring point, said probing head being disposed on a displacement mechanism having at least two supports that can be displaced in parallel to each other. Every support can be displaced by means of its proper drive (28, 30). The space coordinate of the measuring point is determined using the respective displacement position of the supports. According to an aspect of the invention, the two drives are controlled by a common control (90).
