Abstract (en)

[origin: WO2006074861A1] The invention relates to a device and a method for registering the opening of locks of areas that are to be secured. According to the invention, a sealing module, which comprises a sensor, a microprocessor, a memory and a device for wireless communication, can be attached to the lock in such a way that the sensor recognises a displacement and writes data documenting said displacement to the memory. A recording device also comprises at least one unit for wireless communication, a microprocessor and a memory, which are configured to read at least the data documenting the displacement from the memory of the sealing module and to write said data to the memory of the mobile recording device.
