Abstract (en)

[origin: WO2006075105A1] The invention relates to a method by which one of the listeners participating in a group call can interrupt a speaker, said group call taking place in a mobile telephone network that allows group calls. The inventive method is characterised in that it comprises the following steps, namely: a) a step in which the mobile station of the requesting listener accesses a dedicated signalling channel in order to transmit an interruption request to the network, b) a step in which the network processes the request in order to decide whether or not to interrupt the speaker, and c) a step in which the speaker is interrupted when the network has decided to do so.
