Abstract (en)

A refrigerator includes a bottle receiving shelf (30) to receive bottle-shaped containers containing contents. The refrigerator includes a body (10) having a storage chamber (11) defined therein, and a bottle receiving shelf (30) in the storage chamber (11) to allow a bottle-shaped container to be stored in a laid state. The bottle receiving shelf (30) includes a first partition shelf (31) having a first seat (31a), and a second partition shelf (32) having a second seat (32a). The second partition shelf (32) is positioned at a front side of the first partition shelf (31) to move backward and forward, and overlaps the first partition shelf (31) when being moved backward. The first and second seats are alternately arranged in a transverse direction to allow the second partition shelf (32) to overlap the first partition shelf (31) when the second partition shelf (32) is moved backward, so that the bottle-shaped containers can be received in an upright state in the storage chamber (11).
