Abstract (en)
[origin: WO2006075021A1] The invention relates to a method for carrying out continuous olefin ring closing metatheses (RCM), wherein compressed carbon dioxide (gaseous, liquid or supercritical) is used as a solvent for the liquid or solid reactant and the products thereby produced. One or more ionic liquids are additionally introduced as the second phase in which the homogeneous olefin metathesis catalysts are immobilized.
