Abstract (en)
[origin: WO2006080094A1] This invention provides a mechanical car door locking apparatus which is automatically operated by a door drive but independent of a door drive coupling mechanism. According to this invention, when, with a car positioned outside a landing zone, the motion of a first cam moving along with door opening motion is transferred to a first roller, a slider moves along a slider rod in the direction of door opening in conjunction with the motion of the first cam, whereby a static latch moving along with the door opening motion engages with a latch to disable door opening operation.
