Abstract (en)

[origin: WO2006076988A1] The invention relates to a scanning method for an asynchronous sensor (1), according to which sensor data (a) are read out of a sensor element (2) at a scanning rate (t1) and written into an output register (5), and are then read out of the output register (5) at an output transfer rate (t2). According to the invention, a programmable interpolation of at least two scanning values increases the output transfer rate (t2) of the output register (5).
