Abstract (en)
[origin: WO2006083174A1] A device for a saddle tree, where the saddle tree comprises a front portion (pommel) (1) , a middle portion (seat) (3) and a rear portion (cantle) (5) , the saddle being arranged to provide the required support for a rider, in particular by the front and rear portions (1, 5) being arranged to stably abut a horse's back, the rear portion (5) being arranged to form a rear support for a rider, and the seat portion (3) being arranged to form the main part of a seating surface for the rider, while at the same time, the seat portion (3) is suitable for transmitting a variable pressure load from the rider to various parts of the horse's back, where a) the front portion (1) and the rear portion (5) are separate from each other and made from an essentially dimensionally stable material; b) the middle portion (3) is made from an essentially flexible material; and c) the middle portion (3) forms a flexible connection between the front and rear portions (1, 5) .
