Abstract (en)

[origin: WO2006069404A2] A planar printed plastic identification element is formed monolithically within a larger printed planar sheet product with magnetic stripe by scoring such that a magnetic stripe portion on the element is located between first and second scrap magnetic stripe portions on either side of the element by bypassing the first scrap portion when encoding the magnetic stripe portion of the element and thereafter at least essentially eliminating any encoding on the second scrap portion that would interfere with reading data encoded on the element magnetic stripe portion when either edge of the product is passed through a magnetic stripe reader.
