Abstract (en)

[origin: EP1845505A1] A button device (T) moves from an inactive to an active position by pressing. A receptacle (A) for a name badge fits close-by and has a slotted opening (2) for inserting a name badge. The slotted opening fits alongside the button device so that the button device covers the opening when inactive and allows access to the opening for inserting the name badge when in a release position.
