Abstract (en)

[origin: EP1845546A2] The device (100) has a core (30) made of a magnetic material and movably mounted in a frame (10). A displacement unit displaces the core in translation from a rear flange (40) to a front flange (90), and includes a bobbin (80) surrounding the core that is supplied by electric current for generating a magnetic field that produces tensile force of the core. A movable shaft (20) has a free end (20A) that is provided in axial support against the core. The core has a plane end surface that forms a support surface, and a stop is arranged on the shaft.
