Abstract (en)  
[origin: WO2006027029A1] A coating element (10) comprising a support (1) that during the laying steps is connected to the surface to coat, for example by means of nails, screws, glue for building industry, and a decorative element (11). In particular, the decorative element (11) can comprise only a plastic resin layer that then in use is exposed, or alternatively, a decorative layer of different material (12), for example leather, hide, brick-like material, coupled to the resin layer (11) during a process of plastic injection co-molding. The decorative element (10) is then made coupling the decorative element (11) to the support (1) by means of cooperating means suitable for causing a mutual releasable engagement. More in detail, the cooperating means of the decorative element (11) are integrated to it during a plastic injection molding process (40). An interposition layer may be provided suitable to be placed between the support and said decorative layer and having cooperating means, suitable to means of the support, and with reference means, suitable to cooperate with corresponding reference means provided on the decorative layer so that they assist a correct positioning thereof.
