Abstract (en)

[origin: WO2006082005A1] The invention relates to a system for detecting physiological parameters of a living being, which comprises: at least one first sensor (16) adapted to detect a physiological parameter, especially the pulse, of the living being and to produce corresponding physiology parameter data based thereon; at least one second sensor (22) adapted to detect the physical activity of the living being, especially its movement and/or position or orientation in space and to produce corresponding activity parameter data based thereon; at least one recording device (6), connected to the sensors (16, 22) by signals, for detecting the physiology parameter data and the activity parameter data, the recording device (6) comprising a processor unit (24) for comparing the physiology parameter data and the activity parameter data with parameter data that are predetermined or can be predetermined.
