Abstract (en)
[origin: WO2006084691A1] The invention relates to an apparatus for three-dimensionally scanning objects that are moved past a stationary optical sensor (3). Said apparatus comprises a six-legged object support (2) which is used for accommodating the object that is to be scanned and is embodied as a hexapod. In order to create an apparatus which is provided with an inexpensive structure while making it possible to carry out a scanning process that is easy to handle, the object is disposed on a rotary disk (5) supported by the hexapod.
