Abstract (en)

[origin: WO2006082284A1] So-called push technology enables reception of new contents automatically, i.e. without user initiation. In order to enable a connecting party to send data when a receiving application is not even running, and thus cannot receive the data, middleware simulating the application to a connecting party, and an active connection to the application by utilizing buffers is provided. More precisely, the middleware is arranged to buffer incoming (6-7) data on behalf of the application, if the application is not receiving the data, and to allow (6-12) the application to receive (6-13) the buffered data when the application is again willing to receive the data.
