Abstract (en)
[origin: DE102005026725A1] The skis has a plastic made housing (12), to which a binding ski shoe is articulately received. The receiver consists of metal having a closing element (13), which by means of an actuator (16) is tiltably stored in the housing (12) such that a lever (16) can be moved from a closing position, in which the lever is linked, into a release position. The housing (12) has a receiving area on the base (19) where a quick release actuator (16) is provided. A closing element is provided with the quick release actuator within the receiving area in the base for freely accessible assembly or disassembly. The closing element (13) can move from the closing element to the release position by a flexible pre-loaded spring.
