Abstract (en)

[origin: WO2006061393A2] The invention relates to a games set, comprising a game board (300), at least one playing object such as a dice (200) or pawn (100), which may be brought into contact with or into the vicinity of the game board (300), the set further comprising control means (700, 120), at least one part of the extent of the game board (300) comprises means for detection of electromagnetic signals, the object comprises a memory unit (150, 250a) for storage of data information, for reading out said data in order to communicate the same, when the control means are switched on, to transmission means for electromagnetic signals which represent the data stored in memory such as to be received by the detection means (700) and then further transmitted to the central unit (1000), characterised in further comprising a touchpad (500), at least partially covering one face of the game board (300), the pad (500) being sensitive to contact on the essentially free surface thereof with a body having fixed mechanical properties and which may generate a signal relating to the contact established on the surface thereof. Said signal is transmitted to the central unit (1000), which integrates the signals received from the pad (500) and said detection means as data for the electronic game in progress. The invention further relates to game objects.
