Abstract (en)
[origin: WO2006084549A1] Device for containing and/or holding objects, produced from a sheet of cardboard, cut and pre-punched, which comprises a central section, two side flaps and various fastening tabs. The sheet can be folded over to form a hollow prismatic body with various side surfaces which can be closed at its bases by folding the flaps and joining respective fastening tabs. Each side surface has two perforated holes whereby a movable string passes which follows two different paths. When the sheet is in a position closed in on itself, forming the prismatic body and defining a box for containing objects, the string follows a first path to serve as a handle for the box. When the sheet is semi-folded, forming a holder for objects, with a side profile in the form of a zig-zag or similar, the string follows a second path to serve as an element for holding the semi-folded sheet.
