Abstract (en)
[origin: WO2007015718A2] A condensate drain includes a body defining an interior space. An inlet opening is in fluid communication with the interior space of the body for allowing condensate to enter into the interior space, and an outlet opening is in fluid communication with the interior space of the body for allowing condensate to exit the interior space. A steam restricter is disposed in the interior space of the body, the steam restricter is movement between a closed position in which the restricter blocks fluid communication from the inlet opening to the outlet opening and an open position in which the restricter permits fluid communication from the inlet opening to the outlet opening.
