Abstract (en)  
[origin: EP1701090A1] The generator (1) has a continuously heating evaporator surface (8) arranged in a hot gas channel (6) for a hot gas passage in a horizontal direction (x). The generator has steam generating pipes (12) passed through by flowing medium where output collectors (20) are mounted downstream of the pipes on the side of flowing medium, and oriented in a longitudinal direction parallel to the gas direction. Each collector has an integrated water separating element (28) which the collector is connected on the side of flowing medium to several downstream overheating pipes of an overheating surface (10).
