Abstract (en)
[origin: US2009044556A1] The invention relates to a refrigeration device having a main body with a frame and an access opening and a door. The door and the main body each have heat-insulated surfaces and together delimit a heat-insulated compartment and the door is movable between an open position in which access to the heat-insulated compartment can be had through the access opening of the main body and a closed position in which the door cooperates with the frame of the main body restricts access through the access opening of the main body to the heat-insulated compartment. An electrical frame heating assembly is disposed relative to the frame of the main body for heating the frame and has a Peltier element.
