Abstract (en)
[origin: EP1850010A2] The pump (100) has a pump housing (102) formed from an injection molding-plastic material. An electronically commutated direct current motor housing part closes a drying room, which separates a separating can (116) of a housing part (104) from a wet area. An electronic system is arranged on a printed circuit board (61), where conducting paths of the circuit board are in heat-conductive contact with a base (117) of the separating can. A heat-conducting foil (67) is arranged between the base and the plate and couples electronic components, particularly, transistors over the conducting paths.
