Abstract (en)

An interference reduction receiver that is capable of realizing further high-speed great capacity radio communications is offered by accurately obtaining weights in a short time. Further, a method of determining a timing that is effective in interference removal is offered. According to the interference reduction receiver of the present invention, an input signal is despread at two or more predetermined timings, the despread signals are multiplied by predetermined weights, the weight-multiplied signals are added, and an original signal is obtained. The interference reduction receiver includes a weight generating unit for obtaining the weights by multiplying a signal correlation matrix of the input signal and a channel response vector.
