## Abstract (en)

[origin: WO2006089622A1] The invention relates to a dishwasher having an at least approximately parallelepipedal housing (3) which is open towards the front side (4) and having a dishwashing compartment (2) which is open at the top, in the case of which the upper edges (8.1) of the side walls (8) run parallel to the housing cover (7), wherein the dishwashing compartment (2) can be withdrawn from the housing (3) in the manner of a drawer in order to be loaded and unloaded and is pushed completely into the housing (3) during the dishwashing operation, and wherein at least one region (12) of the dishwashing compartment (2) bears against a region of the housing (3), possibly with a seal (13; 16) interposed, during the dishwashing operation. In order to make it possible, in a manner which is simple in design terms but is nevertheless functionally reliable, to seal the dishwashing compartment within the housing, it is proposed that the dishwashing compartment (2) either decreases in width in terms of its outer dimensions from the front to the rear or increases in width in terms of its inner dimensions from the front to the rear, at least in the region of the upper edges (8.1) over approximately the entire length, and that either the housing (3) or a seal (13; 16) arranged on the housing (3) has at least one bearing surface (14; 17) which matches the profile of the dishwashing compartment contour.
