Abstract (en)
[origin: WO2006084603A1] The present invention relates to a catheter comprising a tubular body, a first connector piece, at least one slidable member and at least one elongate member. The first connector piece is permanently attached to the tubular body. The first connector piece and each of the at least one slidable member are arranged to be positioned outside the body. One of the at least one slidable member comprises a second connector piece connectable to the first connector piece. Each of the at least one elongate member has at least one proximal attachment part and a distal coupling part. The distal coupling part of each elongate member is coupled to the distal region of the tubular body and each of the at least one proximal attachment part is attached to one of the at least one slidable member at a proximal attachment point. Each elongate member extends from each respective proximal attachment point to the distal coupling part.
