Abstract (en)

[origin: US2006191933A1] A closure system is provided with a peripheral wall (e.g., as defined either by a top portion of a container for extending from, and defining, an opening or as defined by a separate closure body for extending from a container). The peripheral wall has a laterally inwardly extending sealing member. A lid is provided for being moved from an open position to a closed position on the peripheral wall. The lid has a flange with a peripheral sealable surface for being engaged by the sealing member of the peripheral wall to effect a seal.
