Abstract (en)
[origin: WO2006069411A1] The invention concerns an expansible, hardenable and moldable material consisting of particles coated with a coating material. In the molded element produced with said material, the particles are mechanically in contact with one another and the void volume between the particles is filled with foam in an adjustable manner. This enables the mechanical and isolating properties of the particulate structure to be associated with the mechanical and isolating properties of the hardened foam material. The expanded and hardened material is particularly suitable for applications as isolating material, fireproof material and for high-temperature applications.
