Abstract (en)
[origin: EP1691102A1] A disc brake pad assembly (10) comprises a mounting plate (12; 52; 62) and at least one block (14, 16; 54) of friction material. The mounting plate is adapted to be mounted in a disc brake for movement towards or away from a disc, and the block is mountable on said mounting plate so that said movement of the mounting plate can bring the block into frictional engagement with the disc. The mounting plate is formed with a re-entrant groove (24, 26; 74, 76) having side surfaces (24a, 24b, 26a, 26b) which approach one another, and the block has two opposite end edges (14c, 14d, 16c, 16d) which are shaped so that the block can be inserted into the groove and retained by engagement between the side surfaces of the groove and the end edges of the block. This arrangement enables a replacement block to be mounted on the mounting plate while the mounting plate is in situ in a brake.
