Abstract (en)

[origin: WO2006084959A1] The invention concerns a delocalized fast and easy-to-implement system for automatically creating virtual visits enabling a very large amount of data to be simultaneously processed. Therefor, the invention concerns a digital processing system comprising: an interface (100) viewable on a device (102) such as a computer equipped with a network connection (104), to collect information and data, and to send files; a remote unit (200) for receiving and storing processing files and data connected by a communication network (N) to the interface (100); at least two data processing units (300), connected in parallel to the reception and storage unit (200), each processing unit (300) including a database and a digital processing circuit adapted to detect the presence of a new processing file, and to reserve access for itself to said new file, to process the data based on the information contained in the database and in the processing file in order to create a virtual visit, and to provide the virtual visit to the user.
