Abstract (en)
[origin: EP1852559A1] The device has steel formwork modules cooperating with elements, which include a slab for intimately connecting between the slab and bearing walls or building foundations. The modules formed in a c-shaped thin sheet provide traversing passages (4-6) for a concrete during pouring of the concrete and for retention zones (7). The modules include a c-shaped lower branch (8) fixed on the walls or foundations. The lower branch provides ohm-shaped transversal section, where ends of the section are supported on the walls or foundations and middle section form the retention zone of the poured concrete.
