Abstract (en)

[origin: WO2006084368A1] This application describes fluorinated (+)PHNO and analogs thereof, including radiolabeled analogs, of Formula (I), wherein R<sub>1</sub> is C<sub>1-6</sub> alkyl in which one hydrogen atom on the alkyl chain is replaced with fluoro or radioactive fluoro. The application further describes compositions comprising these compounds and methods of using these compounds. The compounds of formula (I), have good affinity and selectivity for the dopamine D<sub>2</sub> receptors and are therefore useful for the labelling of dopamine D<sub>2</sub> receptors in vivo and for the identification and quantification of the extent of dopamine supersensitivity in the brain in various stages of a dopamine-related disease.
