Abstract (en)
[origin: WO2006083752A2] A Business Method by which otherwise independent nodes of a distribution system can interact via an internet website or other means to equalize inventory to their mutual benefit and profit, with the Business Method Practitioner operating the mechanism and retaining a percentage of each transaction as a fee for the service provided. In the retail world for which the Business Method is primarily intended, this has the collateral benefits of reducing the percentage of overstock goods sold at a discount and understock goods purchased at a premium, raising the overall profitability of the industry served, protecting branding, and improving performance of individual nodes of the market and of the overall market.
