Abstract (en)

[origin: WO2006120096A1] There exist vending machines for delivering cooled liquids and water ice cubes. These vending machines are often integrated into refrigerators, in such a way that one refrigerator door is provided with a delivery shaft into which a drink container is set. For the delivery shaft to be useable with containers of different sizes, and at the same time to ensure a secure support for the containers, the present application proposes a container carrier which has at least one joint and thus can, for example, be folded out of the delivery shaft in order to hold a larger beverage container under the delivery opening in a stable manner.
