Abstract (en)
[origin: WO2006094531A1] Disclosed is a multimodal explosive, especially for blast charges, comprising a powder additive for increasing the power. Said powder additive is formed by a hydrogen-terminated monocrystalline silicon powder which is provided with at least one grain size range and has the advantage that no oxidation phenomenon occurs even after many years, and even when the explosive is stored in ambient air. Advantageously, the powder additive immediately reacts along with the explosive in the detonation front due to the non-oxidized crystal surfaces, said joint reaction lasting until the post-reaction period as the crystal sizes increase such that a different propellant force is obtained according to the additive used.
