Abstract (en)

[origin: WO2006097119A1] The invention relates to a method for producing a moulding body having a predetermined thickness profile, in particular, comprising a uniaxial press. According to the invention, a filling tool of a filling device is filled with a moulding material and the moulding material is guided in the direction of gravity of the filling tool towards a pressing mould. At least two segments of the pressing mould which are arranged adjacent to each other in a direction which extends in a perpendicular manner in relation to the direction of gravity, corresponding to the predetermined thickness profile, are charged with various amounts of moulding materials. The segments of the pressing mould which are arranged next to each other and which correspond to segments which are arranged next to each other are filled with various amounts of moulding materials which correspond to the predetermined thickness profile.
